* De pH wordt na monsterneming binnen 24 uur gemeten op het laboratorium en kan in zwak gebufferd water afwijken van een "in-situ" gemeten waarde.

** Bij membraanfiltratietechnieken (coliformen, E. coli, enterococcen, sulfiet reducerende clostridia, (thermotolerante) bacteriën van de coligroep, faecale streptococcen en pseudomonas) geldt een statistisch significant telgebied tussen de 10 en 100 verdachte kolonies per plaat.
Bij de gietplaatmethode (koloniegetal 22 °C, 30 °C en 37 °C) geldt een statistisch significant telgebied tussen de 10 en 300 kolonies per plaat.
Bij de strijkplaatmethode (koloniegetal R2A 25 °C) geldt een statistisch significant telgebied tussen 10 en 200 kolonies per plaat.
Bij de strijkplaatmethode voor legionella species geldt een statistisch significant telgebied tussen de 10 en 150 kolonies per plaat.
Indien er een telling buiten de hierboven genoemde telgebieden gerapporteerd wordt, kan de geraporteerde waarde als indicatief worden beschouwd.
